

### Specification Amendments

Please amend lines 10-11, page 13, of the Specification as follows:

The hub 5, in this case, is fixed nonreleasably to the wheel carrier 8 7 via the flange rim 5b.

Please amend line 20, page 14, of the Specification as follows:

Figure 2a shows the shape deviations of the outer ring 2 as an individual component in comparison with the internal geometry  $2r$  of the hole 7a. On account of its thin wall after cold forming or after curing, the outer ring 2 has a finished external geometry  $2r$ , the diameter  $D_A$  of which is initially greater by the excess dimension  $2 \times U$  than the internal diameter  $D_I$  of the hole 7a. In addition, the external geometry  $2s$  deviates by the amount  $2 \times V$  from the internal geometry  $2r$  of the hole 7b 7a.
